

Asset Health Indicator Guide Feedback Summary

June 2015

In what situations have you used the EEA's AHI Guide?

- Limited as we used our Preventive maintenance indicators
- To help promote EEA & AHI to others in the industry. At Orion we use CBRM and our own “in house” developed HIs.
- Planning Hydro generator Condition assessment programmes
- Used AHIs to visualise capex along with future capital expenditure requirements. Also used to create risk profile of our business. Used to remove subjectivity of asset life/ health decisions.

What areas have you found beneficial or helpful?

- Will look at aligning our AHI measures with the Guide.
- To show others (senior management, Board) that this is key area of interest for the industry.
- Generation
- Risk matrix – we used 4 matrices – safety, asset health, environmental and enterprise risk. Good to have majority of electrical assets covered.

What areas were not so beneficial or could be improved?

- Our Preventive maintenance was focused too much on finding defects to fix rather than assessing the remaining life.
- Sorry – can't think of anything.
-
- Like to see some more on rotating machines – turbines or generators for small machines. Realising there is a comprehensive guide developed by large generators.
